Generator Synchronization 08/02/2011 by Lemau 8 Comments Most of the electricity consumed today is produced by three phase synchronous generator. Since a huge amount of electricity is consumed every day, AC power networks are generally made up of a large number of synchronous generator all operating in the same frequency.

Synchroscope is LED is showing how much difference is their in the frequency of dg and grid voltage. If LED is in too slow region then we need to raise governor speed and vice versa. The guy first raises speed manually and then put in auto mode which makes DG frequency same as grid frequency by slowing down governor. I hope you are cleared.

In an alternating current electric power system, synchronization is the process of matching the speed and frequency of a generator or other source to a running network. An AC generator cannot deliver power to an electrical grid unless it is running at the same frequency as the network. If two segments of a grid are disconnected, they cannot exchange AC power again until they are brought back ...
