Kinetic energy and gravitational potential energy are beautifully intertwined in the Energy of a Pendulum Gizmo. In this simple but very effective Gizmo, students view the kinetic and potential energy of a pendulum as it swings back and forth. On the downswing, the pendulum drops lower and its potential energy decreases.

Both the potential energy and kinetic energy increase. Correct Answer: B. The potential energy decreases while the kinetic energy increases. Explanation: As the pendulum swings toward its lowest position, the height of the pendulum bob decreases and its speed increases. Potential energy is dependent on the height of the bob. Therefore, the potential energy is decreasing.

The kinetic energy would be $KE = \frac{1}{2}mv^2$, where m is the mass of the pendulum, and v is the speed of the pendulum. At its highest point (Point A) the pendulum is momentarily motionless. All of the energy in the pendulum is gravitational potential energy and there is no kinetic energy. At the lowest point (Point D) the pendulum has its greatest speed.

In the meantime, he began the science of harmonic motion and inspired the invention of the pendulum clock. The Simple Harmonic Motion Gizmo explores the oscillations of pendulums and springs. Students manipulate the mass and stiffness of the spring and the mass and length of the pendulum, as well as the strength of gravity, to see how each factor affects—or doesn't affect—the period of the motion.

As the bob begins to move, its GPE is transformed into kinetic energy (KE), or energy of motion. When the pendulum is at the part of its period where it is at a 90 degree angle with the floor, its original GPE has been entirely transformed into KE. As it continues to swing and move upward on the arc, the KE is transformed back to GPE.
