Graphing a Circle. Graphing circles requires two things: the coordinates of the center point, and the radius of a circle. A circle is the set of all points the same distance from a given point, the center of the circle. A radius, r , is the distance from that center point to the circle itself. On a graph, all those points on the circle can be determined and plotted using (x, y) coordinates.

To graph a linear equation, start by making sure the equation is in $y = mx + b$ form. Then, plot the b value on the y -axis. Next, convert the m value into a fraction if it's not already by placing it over 1. Once you've done that, start at the point you plotted on the y -axis, and count up the number that's in the numerator of the fraction.

Purplemath. You've already learned the basic trig graphs. But just as you could make the basic quadratic, $y = x^2$, more complicated, such as $y = -(x + 5)^2 - 3$, so also trig graphs can be made more complicated. We can transform and translate trig functions, just like you transformed and translated other functions in algebra. Let's start with the basic sine function, $f(t) = \sin(t)$.

The graph of a quadratic function is a smooth, U-shaped curve that opens either upward or downward, depending on the sign of the coefficient of the x^2 term. The vertex and intercepts offer the quickest, easiest points to help with the graph of the parabola. You can resort to solving for other points if the [...]

Cartesian graphs are what mathematicians really mean when they talk about graphs. They compare two sets of numbers, one of which is plotted on the x-axis and one on the y-axis. The numbers can be written as Cartesian coordinates, which look like (x,y) , where x is the number read from the x-axis, and y the number from the y-axis.
