Chapter 7: Hypothesis Testing - Solutions 7.1 Introduction to Hypothesis Testing The problem with applying the techniques learned in Chapter 5 is that typically, the population mean (μ) and standard deviation (σ) are not known. In chapter 7, we will be looking at the situation when a simple random sample is taken from a large population with ...

Hypothesis Test - Problems and Solutions - BrainMass

Hypothesis testing is a statistical process to determine the likelihood that a given or null hypothesis is true. It goes through a number of steps to find out what may lead to rejection of the hypothesis when it's true and acceptance when it's not true. This article discusses the steps which a given hypothesis goes through, including the decisional errors that could happen in a statistical ...

Hypothesis Testing - Writing, Examples and Steps

Hypothesis testing is like a litmus test that gives us the path for rejection or acceptance of an assumption or a claim except for the fact that it is not deterministic but probabilistic. It is a technique to compare two datasets or a sample from a dataset.

Chapter 6 Hypothesis Testing

Hypothesis testing is a decision-making process for evaluating claims about a population. We must define the population under study, state the particular hypotheses that will be investigated, give the significance level, select a sample from the population, collect the data, perform the calculations required for the statistical test,

Hypothesis Testing The idea of hypothesis testing is: Ask a question with two possible answers Design a test, or calculation of data Base the decision (answer) on the test Example: In 2010, 24% of children were dressed as Justin Bieber for Halloween. We want to test whether or not this proportion increased in 2011.

If the biologist set her significance level (α) at 0.05 and used the critical value approach to conduct her hypothesis test, she would reject the null hypothesis if her test statistic t^* were less than -1.6939 (determined using statistical software or a t-table):s-3-3. Since the biologist's test statistic, $t^* = -4.60$, is less than -1.6939, the biologist rejects the null hypothesis.

Two-Sample Problems

The statement of our problem will determine which kind of test to use. If the alternative hypothesis contains a "not equals to" sign, then we have a two-tailed test. In the other two cases, when the alternative hypothesis contains a strict inequality, we use a one-tailed test. This is our situation, so we use a one-tailed test.
