Special Issue "Application of FEM-Simulation in Metal Forming"

Forming, metal forming, is the metalworking process of fashioning metal parts and objects through mechanical deformation; the workpiece is reshaped without adding or removing material, and its mass remains unchanged. Forming operates on the materials science principle of plastic deformation, where the physical shape of a material is permanently deformed.

Forming (metalworking) - Wikipedia

Early attempts in the modeling of metal forming processes were directed towards the prediction of forces required in metal forming. For example, for calculating the roll pressure distribution and torque in rolling, von Karman [12] developed the differential equation of the process.

Young's modulus has a strong effect on the mechanical behavior of elastic-plastic materials, such as elastic stiffness, elastic recovery, and potential energy. Since springback prediction is important in the sheet metal forming process, many of Young's modulus studies have been focused on capturing the amount of springback. This work investigated the effect of Young's modulus modeling ...

Chapter 4 is focused on modelling the evolution of voids in porous metals with applications to forming limit curves and ductile fracture. The chapter details the steps needed for the development of dissipation functions and Gurson-type models for non-quadratic anisotropic plasticity criteria like BBC 2005 and those based on linear transformations.

LS-DYNA can be used in Sheet Metal Forming for die face design evaluation, so you can be at ease when you cut the die. Material Modeling To get an accurate analysis, model information is critical, sometimes you have to develop your own material model, most of the time, you need to get the material tested and convert the test data to feed the correct material information to the simulation
