Sensorless Field Oriented Control of 3-Phase Permanent ...

The Field Orientated Control consists of controlling the stator currents represented by a vector. This control is based on projections which transform a three phase time and speed dependent system into a two coordinate (d and q coordinates) time invariant system. These projections lead to a structure similar to that of a DC machine control.

Sensorless Field Oriented Control of 3-Phase Induction Motors

This example implements the field-oriented control (FOC) technique to control the speed of a three-phase permanent magnet synchronous motor (PMSM). For details about implementing FOC, see Implement Motor Speed Control Using Field-Oriented Control (FOC). This example uses the sensorless position estimation technique.

The purpose of this application note is to illustrate a software-based implementation of sensorless, field oriented control for PMSM using Microchip digital signal controllers. The control software offers these features: • Implements vector control of a PMSM. • Position and speed estimation algorithm. eliminates the need for position sensors.

Sensorless Field Oriented Control (FOC) of a Permanent ...

Vector control, also called field-oriented control, is a variable-frequency drive control method in which the stator currents of a three-phase AC electric motor are identified as two orthogonal components that can be visualized with a vector. One component defines the magnetic flux of the motor, the other the torque. The control system of the drive calculates the corresponding current component references from the flux and torque references given by the drive's speed control. Typically proportio
