SD cards are serial data cards and thus have limits to the speed that they can transfer data. As SD cards evolved so has their speeds and there are new designations to determine which cards are faster than others. Older cards used a Class designation from 1 to 10, with a 10 being the fastest.

The micro SD card module contains two main components that make it undoubtedly easy to add data logging to your next Arduino project: The operating voltage of any standard micro SD Cards is 3.3 V. So we cannot directly connect it to circuits that use 5V logic. In fact, any voltages exceeding 3.6V will permanently damage the micro SD card.
